

SUPAKORN UDOMSINTUWAT

Full Stack Software Engineer

Chiang Mai, Thailand • +66808656423 • supakornboon5039@gmail.com • github.com/supakorn5039-boon

PROFESSIONAL SUMMARY

Full Stack Software Engineer with experience taking products from architecture through production. Works across React and TypeScript frontends, Laravel and Go backends, PostgreSQL data systems, CI/CD, and cloud infrastructure. Recent work includes a government detection platform operating at tens of millions of records and a commercial real-estate platform delivered and operated independently.

TECHNICAL SKILLS

Languages:TypeScript, JavaScript, Go, PHP, Python, SQL
Frontend: React 19, Next Js, TanStack Query, Zustand, Tailwind CSS, shadcn/ui, React Hook Form, Yup, Zod, Leaflet, Recharts
Backend & Data: Laravel, Gin, GORM, REST APIs, PostgreSQL, TimescaleDB, Redis, Elasticsearch, MySQL, MongoDB
Cloud & Delivery: AWS EC2/RDS, Cloudflare R2, Docker, Kubernetes, nginx, GitHub Actions, GitLab CI, SonarQube, Linux

EDUCATION & CREDENTIALS

Bachelor of Engineering
Information Systems and Network Engineering
Chiang Mai University · International Program
CMU E-Graduate: 78/100
Certifications
Full-Stack Development — LinkedIn Learning
Cloud Security & Cybersecurity
Essentials — Cisco
Languages
Thai — Native
English — Upper-Intermediate (B2)

PROFESSIONAL EXPERIENCE

FireExit Cooperation Co., Ltd.—Chiang Mai, Thailand
Jan 2026 – Present

Full Stack Software Developer

CIB Vision — Face-Detection Intelligence Platform, Central Investigation Bureau
Dec 2025 – Present

Owned the Laravel and React application end to end, including architecture, ingestion, search, dashboards, access control, testing, containers, and Kubernetes manifests, while integrating with CIB-provided AI detection, government APIs, ThaID, and infrastructure.

- Kept burst traffic away from the request path by acknowledging detection webhooks immediately and processing deduplication, enrichment, persistence, and Telegram alerts through Redis-backed workers.
- Moved detection data to TimescaleDB hypertables with seven-day compression and continuous aggregates as production reached approximately 70 million records and 1–2 million new events per day.
- Cut person-search latency from 10+ seconds to under one second after measuring index behavior on production data and replacing ineffective GIN indexes with composite and partial indexes plus aggregate-backed time-bucket searches.
- Removed foreign-key bottlenecks from the compressed detection table and added guarded pruning for stale master data; the production cleanup completed in seven seconds without modifying detection records.
- Enforced camera-level access on the server for approximately 1,800 cameras across 3,700 police units, combining role permissions, organization-based grants, manual overrides, and ThaID identity data.
- Ran the application on CIB-provided infrastructure using Docker, Kubernetes workers and scheduled jobs, GitLab CI, Harbor, SonarQube, and ELK logging that excludes PII.
- Maintained backend and end-to-end regression coverage with Playwright and mocked integrations for services available only through the government VPN.

SELECTED PROJECT EXPERIENCE

Wealthy Prime Estate— Full Stack Engineer & Platform Owner

May 2026 – Present

wealthyprimeestate.com · Client production handover: Aug 2026

Independently took a property-brokerage platform from requirements and architecture to production handover in approximately 10 weeks, and continues to operate it for the client.

- Chose Go/Gin and PostgreSQL for a maintainable API covering property search, bookings, agent workflows, administration, financial exports, and audit history.
- Delivered the React 19 frontend in strict TypeScript with separate customer, agent, and admin flows and full Thai, English, and Chinese localization.
- Kept owner contact details and documents out of every public response; only assigned agents and administrators can access them.
- Used HMAC-signed property and agent identifiers for tamper-resistant review links, allowing verified post-visit reviews without requiring customer accounts.
- Moved the backend and database from US-West to AWS Singapore, reducing API latency for Thai users by approximately 150–200 ms while preserving existing JWT sessions.
- Runs production for approximately \$30 per month on ARM EC2, private encrypted RDS PostgreSQL, Cloudflare, and R2, with backups and network-isolated database access.
- Set up GitHub Actions deployment with AWS OIDC and just-in-time SSH rules that authorize only the runner IP and are revoked after every deployment, including failed runs.

ADDITIONAL EXPERIENCE

FireExit Cooperation Co., Ltd.—Software Developer, Frontend

Oct 2024 – Dec 2025

Frontend Architecture

- Built reusable React component patterns and shared UI foundations with shadcn/ui, Headless UI, and MUI, reducing duplicated implementation across internal projects.

Industrial IoT & Monitoring

- Developed real-time interfaces for device status, network monitoring, sensor telemetry, vehicle tracking, and utility dashboards using React, Next.js, and TypeScript.

Enterprise Systems

- Delivered scheduling and room-booking interfaces with availability logic and backend API integration for enterprise operations.

Ocare Health Hub Co., Ltd. — Software Engineer, Frontend

Jan 2024 – Sep 2024

- Developed React and Next.js interfaces for patient reports, clinical history, diagnostic results, and REST API-based record synchronization.
- Turned healthcare workflows into accessible clinician dashboards and refined prompts used to generate MongoDB queries for record retrieval.

AI-ASSISTED ENGINEERING

- Uses Claude Code to speed up implementation, testing, performance analysis, migration planning, and delivery within repository-defined architecture and constraints.
- Reviews and validates the work with automated tests, production measurements, guarded scripts, and operational checks.
